

John Li

San Antonio, TX | junhui.li.engineer@gmail.com | (814) 351-1541

PROFESSIONAL SUMMARY

Senior Data Engineer with 9+ years of experience designing and delivering **enterprise data platforms within the Microsoft Azure ecosystem**, including **Azure Data Factory, ADLS, Databricks, Synapse Analytics, and Azure SQL**. Proven ability to **lead client-facing engagements**, architect modern **data lakehouse solutions**, and implement scalable ETL/ELT pipelines that support analytics, reporting, and business intelligence. Strong expertise in **dimensional modeling (Kimball methodology), API ingestion, and data governance**, with a track record of mentoring teams and driving adoption of best practices across organizations.

SKILLS

- **Cloud:** Azure (ADF, ADLS, Synapse, Databricks, Azure SQL)
- **Languages:** Python, SQL, PySpark
- **Data:** ETL/ELT, Data Modeling, Lakehouse
- **Tools:** Spark, Fabric, Data Factory, Synapse
- **Integration:** REST APIs, OAuth, JSON
- **Practices:** Dimensional Modeling, Governance, CI/CD

PROFESSIONAL EXPERIENCE

Senior Data Engineer | Tencent

07/2023 – 02/2026

- Led architecture and implementation of enterprise-scale data solutions aligned with Azure-based lakehouse principles, designing data pipelines, storage layers, and transformation workflows that supported analytics, reporting, and operational decision-making across multiple business domains.
- Designed and implemented end-to-end ETL/ELT pipelines using Spark and Python, enabling ingestion, transformation, and delivery of high-volume datasets into structured data models optimized for reporting and analytics use cases.
- Built and optimized dimensional data models using Kimball methodology, including star schemas and fact/dimension tables, ensuring efficient querying, scalability, and alignment with business intelligence requirements.
- Developed metadata-driven data orchestration frameworks, enabling reusable and scalable pipeline design, improving maintainability, and supporting automation and standardization across data engineering workflows.
- Integrated data from multiple external and internal sources using REST APIs and OAuth authentication, handling JSON data transformation, normalization, and mapping into relational structures suitable for analytical processing.

- Collaborated directly with business stakeholders, analysts, and technical teams to gather requirements, conduct design sessions, and translate business needs into scalable and maintainable data solutions.
- Led troubleshooting and resolution of complex data pipeline issues, including performance bottlenecks, data inconsistencies, and integration failures, ensuring high data quality, reliability, and system uptime.
- Mentored junior data engineers and contributed to establishing best practices for data modeling, pipeline design, and documentation, fostering a culture of continuous learning and technical excellence.

Senior Data Engineer | AppDirect

02/2019 – 05/2023

- Designed and implemented scalable data pipelines using modern cloud-based architectures, enabling ingestion, transformation, and delivery of large-scale datasets for analytics, reporting, and operational insights.
- Built robust ETL/ELT workflows leveraging Python, SQL, and Spark-based processing, supporting high-volume data processing and ensuring performance optimization and scalability.
- Developed dimensional data models, including star schemas and normalized structures, supporting enterprise reporting, financial analysis, and business intelligence initiatives.
- Implemented API-based data ingestion frameworks, integrating data from external systems using REST APIs and OAuth, and transforming semi-structured JSON data into structured relational formats.
- Collaborated with cross-functional teams including BI developers, analysts, and cloud engineers to design and deliver comprehensive data solutions aligned with business objectives.
- Improved data quality and governance by implementing validation frameworks, monitoring processes, and data consistency checks, ensuring trust in data used for decision-making.
- Contributed to design and implementation of data lake and warehouse solutions, combining best practices from both architectures to support flexible and scalable analytics platforms.
- Participated in client-facing discussions and internal design sessions, helping define solution architecture, provide technical guidance, and ensure alignment with project scope and requirements.

Data Engineer | Meta (Facebook)

03/2018 – 02/2019

- Developed scalable data processing pipelines supporting large-scale analytics workflows, enabling efficient processing and transformation of high-volume datasets across distributed systems.

- Designed and implemented data models and storage solutions optimized for analytical workloads, ensuring efficient querying and performance for reporting and business intelligence use cases.
- Built ETL pipelines supporting both batch and near real-time processing, enabling timely availability of data for analytics, monitoring, and operational insights.
- Collaborated with engineers and analysts to define data requirements and implement scalable solutions that supported evolving business needs and data growth.
- Optimized data processing performance through query tuning, data partitioning, and efficient transformation logic, improving system efficiency and reducing processing time.
- Implemented monitoring and logging mechanisms to track data pipeline performance, detect anomalies, and ensure reliability of critical data systems.
- Investigated and resolved data-related issues, ensuring data accuracy, consistency, and availability across systems.
- Contributed to documentation and knowledge sharing, improving maintainability and scalability of data infrastructure.

EDUCATION

Master's Degree in Computer Science – University of Michigan

Bachelor's Degree in Computer Science – Zhejiang University

LANGUAGES

- English (Native)
- Chinese (Native)
